

Title

User data remains visible in other session

Priority

High

Based on the information I have this looks like a bug that exposes member information. It is quite possible I have misunderstood and my expectations are incorrect so I would treat this as a high priority issue but start by clarifying my understanding first and adjust priority or close based on new information.

Description

Successfully paid for club membership with a test user 'Robert Hoskins'

When repeating this with a new test user I can see that previous user data is still visible

My understanding is that each session should be clean

"It's your own isolated instance — poke at it freely; re-open the link for a clean slate."

However this looks like we will expose personal user data

I also tried clearing the cache and with new sessions on alternate browsers

In all cases I can see the user data for my first test user
