

Title

Payment seems to ignore the last 4 digits of the card number

Priority

High

I am making an assumption in this exercise that a third party payment system would verify these fields when handling a transaction and that this example would fail to be processed so a client is not charged. (same as medium issues)

However I would treat this as a high priority because it would need more investigation to clarify what exactly is wrong and refine the issue (or break it up into multiple small issues) and then we can adjust the priority as needed.

Description

Valid card number is 16 digits : 4242 4242 4242 4242

I can make a successful payment using an alternate card (1234 1234 1234 1234)

Seems we may be ignoring the last 4 digits which leads to a default card number on the receipt

But I can also make a successful payment using a shorter card number: 4242 4242 4242

However the receipt shows **** * 4242 which is not the card number entered

Fee	€45.00
Card	**** * 4242
Status	Succeeded

In another example,

I can avoid card number validation by moving letters to last 4 digits

Using card number: 1234 1234 abcd 1234

I get an error for failing validation

Your card was declined (invalid_number). Please check the details and try again.

Using card number: 1234 1234 1234 abcd

I get a successful payment and again I see the incorrect card number

Fee	€45.00
Card	**** * 4242
Status	Succeeded
